

Beyond Standardization: A Comprehensive Review of Topic Modeling Validation Methods for Computational Social Science Research

Analysis Replication File

This jupyter notebook runs all the analysis steps that have been taken to get the descriptive numbers and visualizations. Please note that graphs might look different on your machine, depending on your settings. The code is not commented on in detail, however, the headings should give an insight into what the code is doing. The variable labels have been given during coding, so some of them are not as readable as others. In case there are any errors or inconsistencies please contact [the authors].
